

Hey Lawrence,

I wanted to jot down a quick note about something strange I observed during one of our recent tests with Aquabeam. I swear I saw that stuff move on its own in the test beaker. I know it sounds crazy, but I was watching it closely, and there was definite, autonomous movement.

At first, I thought it was just some reaction to a change in temperature or maybe the beaker's surface, but the more I watched, the more convinced I became that this wasn't just a random reaction. The glob seemed to be actively seeking out the oils we introduced, almost as if it had a mind of its own.

Let's discuss this in more detail when you have a moment.

Best,
Albert
